

Utilities, Are You Ready for the 2020s?

Why You Will Need Strong EIM and EDM for the Next Decade's Data

The changes that the 2020s will bring portend an increasing demand for effective Engineering Document Management (EDM) and Drawing Management, primarily due to the increasing volume of new engineering documents and drawings in the world of the future. Is your current infrastructure ready to handle the changes? If your utility is just “making do” with disconnected, antiquated systems not specifically designed for EDM and drawings management, you likely will have an inadequate foundation for the 2020s.

As Industry 4.0 brings ever more powerful solutions that can deliver minute-by-minute information, utilities must be able to leverage this data to deliver better and more economical services, improve workflows, and facilitate compliance with ISO 55000.

But for some utilities, it will be a challenge to monitor, analyze and act on this increasing volume of engineering information.

Here is the link to download the EBook:

<https://www.accruent.com/resources/ebooks/getting-ready-2020s-utilities-need-strong-eim-edm>

In this eBook, you'll find:

Learn how to optimize plant performance by expediting the achievement of deliverables and reducing labor spent sorting out document and drawings questions

A discussion of data-related challenges that utilities will face in the 2020s

Highlights from case studies of organizations who have met similar challenges

A self-assessment tool to determine your readiness for the 2020s

The future is an exciting one for utilities.

By building the foundation for the new connected technologies, you can get ready for 2020s.
